Qi portal upgrade - new download function

To help **integrate Qi's unique macro data into your investment process**, we have added a new feature. One year's history of model data is now available to be **downloaded into excel**. Each Qi model contains a number of core outputs:

- Macro-warranted model value
- Macro model confidence
- Fair Value Gap
- Factor sensitivities

All of this information can now be downloaded into an excel file, thereby enabling clients to take the data & add into their own analysis.

- To help finesse trade timing, PMs can overlay Qi FVGs with technical analysis or any in-house proprietary investment scoring systems.
- Stock pickers can utilise macro model confidence to gauge when single stocks are being driven by bottom-up company fundamentals, or the broader macro environment.
- All investors can pull in historical factor sensitivities to monitor changes in factor leadership.
- Fund marketers can use Qi data / charts in IR reports & pitch decks. Being seen to embrace best-in-class quantamental techniques can only help the asset gathering process!

On each model page, simply click on "*Manage Model*" in the top right hand corner to access 1 year's history of Qi's macro datasets.

Qi's data starts in Jan 2009 – a full history is available via the Qi API.
